## Why Should You Diversify?

Apr 01, 2020

**With US stocks outperforming non-US stocks in recent years, some investors have again turned their attention toward the role that global diversification plays in their portfolios.** For the five-year period ending March 31, 2020, the S&P 500 Index had an annualized return of 6.73%, while the MSCI World ex USA Index lost 0.76% and the MSCI Emerging Markets Index declined by 0.37%. As US stocks have outperformed international and emerging markets stocks over the last several years, some investors might be reconsidering the benefits of investing outside the US.

While there are many reasons why a US-based investor may prefer a degree of home bias in their equity allocation, using return differences over a relatively short period as the sole input into this decision may result in missing opportunities that the global markets offer. While international and emerging markets stocks have delivered disappointing returns relative to the US over the last few years, it is important to remember that:

- Non-US stocks help provide valuable diversification benefits.
- Recent performance is not a reliable indicator of future returns.

### THERE'S A WORLD OF OPPORTUNITY IN EQUITIES

The global equity market is large and represents a world of investment opportunities. As shown in **Exhibit 1**, nearly half of the investment opportunities in global equity markets lie outside the US. Non-US stocks, including developed and emerging markets, account for 46% of world market capitalization and represent thousands of companies in countries all over the world. A portfolio investing solely within the US would not be exposed to the performance of those markets.

**Exhibit 1**

## THE LOST DECADE

We can examine the potential opportunity cost associated with failing to diversify globally by reflecting on the period in global markets from 2000–2009. During this period, often called the “lost decade” by US investors, the S&P 500 Index recorded one of its worst 10-year performances with a total cumulative return of –9.1%. However, looking beyond US large cap equities, conditions were more favorable for global equity investors, as most equity asset classes outside the US generated positive returns over the course of the decade (see **Exhibit 2**). Expanding beyond this period and looking at performance for each of the 11 decades starting in 1900 and ending in 2010, the US market outperformed the world market in five decades and underperformed in the other six. This further reinforces why an investor pursuing the equity premium should consider a global allocation. By holding a globally diversified portfolio, investors are positioned to capture returns wherever they occur.

**Exhibit 2****Global Index Returns**

January 2000–December 2009

	Total Cumulative Return (%)
S&P 500 Index	-9.10
MSCI World ex USA Index (net div.)	17.47
MSCI World ex USA Value Index (net div.)	48.71
MSCI World ex USA Small Cap Index (net div.)	94.33
MSCI Emerging Markets Index (net div.)	154.28
MSCI Emerging Markets Value Index (net div.)	212.72

**PICK A COUNTRY?**

Are there systematic ways to identify which countries will outperform others in advance?

**Exhibit 3** illustrates the randomness in country equity market rankings (from highest to lowest) for 22 different developed market countries over the past 20 years. This graphic conveys how difficult it would be to execute a strategy that relies on picking the best country and the resulting importance of diversification.

In addition, concentrating a portfolio in any one country can expose investors to large variations in returns. The difference between the best- and worst-performing countries can be significant. For example, since 2000, the average return of the best-performing developed market country was approximately 32%, while the average return of the worst-performing country was approximately -15%. Diversification means an investor is unlikely to have the best- or worst-performing portfolio relative to any individual country, but diversification also provides a means to achieve a more consistent outcome and more importantly helps reduce and manage catastrophic losses that can be associated with investing in just a small number of stocks or a single country.

**A DIVERSIFIED APPROACH**

Over long periods of time, investors may benefit from consistent exposure in their portfolios to both US and non-US equities. While both asset classes offer the potential to earn positive expected returns in the long run, they may perform quite differently over short periods. While the performance of different countries and asset classes will vary over time, there is no reliable evidence that this performance can be predicted. An approach to equity investing that uses the global opportunity set available to investors can provide diversification benefits as well as potentially higher expected returns.
